

ABSTRACT OF THE DISCLOSURE

A peripheral device for information processing performs cable communication with an information processing apparatus to access a card-type data storage medium. The storage medium is inserted in a slot of the peripheral device. A label on which printing can be performed is stuck on the outer surface of the storage medium. The peripheral device has a printing section for performing printing on the label on the storage medium. The printing section prints the contents of access to the storage medium on the label on the storage medium by using a thermal head while the storage medium is inserted in the slot.
